Thanks, and sounds good, I think . Will discuss with Catherine and consider it more for upcoming visit, or towards spring when ground is thawed and we have better context.

Hi Team,

Below is Ashley's response to provide more context to the restoration plans. Please let me know if you have any follow up questions or concerns you'd like me to pass back to Ashley and the Eversource team. Thanks!

The mix proposed is commonly used by contractors for stabilization due to the quick germination rate and these plants commonly being present in NH, but we definitely understand and support the desire for a native-dense seed mix within WMNF.

We anticipate roughly 5+ acres of area that will be disturbed and require restoration within WMNF.

For temporary stabilization during construction, we propose weed-free straw mulching areas to prevent erosion and allowing them to revegetate from the native seed bank. When performing final restoration activities, matting will be removed from the interior of WMNF towards the outward entry roads. During this process we would like to add an approved seed to assist with stabilization, as needed. Once matting is removed it will be very difficult to revisit areas to add seed as equipment will no longer be able to access the ROW. We would utilize the NE Wetland Plants, Inc. mixes that were recommended.

We can certainly discuss more during the next site visit, tentatively in late February, but please let me know if there are any questions in the meantime with the proposed approach.

Subject: RE: Eversource B112: Wetland Monitoring

Hi Jasmin – the proposed seed mix is not ideal as it contains all non-native seed; our S&Gs call for using native seed as much as possible. Since there is very little non-native presence in the powerline to begin with, it would be good to keep it that way, so in this context I can't endorse that seed mix. My recommendations may depend on the individual situations. And it would be helpful to have some additional context. For example:

- Do they have an estimate how much area will be disturbed (ie ft² or acreage) and potentially need revegetation?
- And how much of these areas consist of disturbed native soil material vs new material brought in?
- How much on steep ground where quick establishment may be needed? I think Kristi/Maddy might want to weigh in on what kind of slopes really require seeding vs. potentially just letting native seed bank do its thing.

In general, our default with native soil material revegetation, and areas that are relatively small, is to let native seed bank do the revegetation on its own, perhaps with some non-persistent annual like winter rye just to get something established quickly. If the disturbance is really heavy – ie deep churning of native soil material – vs just relatively light surface soil scarification, we might want to seed with a mix.

If we are talking B112 only, since it is happening entirely during the winter, I don't think we want to seed any disturbed wetlands since they should regrow, and since they should be fairly protected by the platforms – but yes, maybe straw for erosion control? The uplands depends on the questions above, in part.

In situations where we think we need or want to reseed, and if we aren't talking about huge acreage, they could use these mixes from NE Wetland Plants, Inc – such as Logging Road Mix or the Dry site mix. These mixes use either no perennial non-natives, or only small amounts to help establish a light matrix to increase the success of establishment of the native species.

<https://newp.com/product/new-england-logging-road-mix/>

<https://newp.com/product/new-england-erosion-control-restoration-mix-for-dry-sites/>

I think we would have more context and better recommendations if we review the areas in the spring after they are finished and finalize recommendations then. If that is not feasible, they should go with one of the mixes from NE Wetland Plants or approved alternative with native seed.

Subject: RE: Eversource B112: Wetland Monitoring

Good morning Team,

Thanks for a great field visit last week! There will be more opportunities for those who didn't make it. I did write up a little summary (post-SOPA call) of each visit and filed them in the project folder ([1](#)) [EversourceB112TLineRebuild | Powered by Box](#). Catherine and Kristi – if you have photos from last week, can you either send them to me or drop them in the word doc? Thanks!

Ashley was able to get the seed mix the contractor is proposing for restoration – see attached. This is used in uplands and the wetlands are mulched for stabilization to allow the native seed bank to revegetate. Catherine and Dan – please let me know if there are any questions on the selection.

As far as timing for the next site visit to structure 78 (Canada mountain rice grass area), Ashley is projecting out to the end of February. I'll be in touch as we get closer to lock in a date.

Thanks everyone!
Jasmin

Hello – who other than Catherine is going, or not? We are interested in seeing the wetland matting etc as far as it might affect vegetation, but wetlands is technically covered by the hydro and or soils folks as far as our official voice. So if Catherine is going alone she might be able to report back, but otherwise we might want to wait for an opportunity when hydro/soils are available.

Subject: RE: Eversource B112: Wetland Monitoring

Hi everyone,

For those of you available on this Thursday, January 11th, Ashley has confirmed that the Eversource crews will be ready to place matting at structures 108-110. They anticipate they'll be able to complete matting activities at this particular location in one day. I told her that we can meet on site at 0800 but will have to head back to Campton in time for Catherine's 1030 engagement. It'll give us about an hour to observe their work and not get too frozen. Conditions will likely be slick with the winter weather so just a friendly reminder to have appropriate PPE—Hard hats, safety vests & glasses, appropriate footwear with traction.

To summarize, we'll plan to leave FHQ at 0700 and be back by 1000ish. Please let me know if you can make it.

Thanks,
Jasmin

Subject: RE: Eversource B112: Wetland Monitoring

Hey Team, another update from Ashely:

Unfortunately there are some posted roads along the route which prevent the crews from moving heavy equipment and matting. Looks like work on the wetland areas is going to be pushed further out, currently estimated for Wednesday January 3 or Thursday Jan 4. I'm hoping the timing in the new year will accommodate more schedules. No need yet to let me know if you're available – we'll do it on my next round of updates. Again, apologies for the constant change up – I appreciate your flexibility and understanding.

Thanks,
Jasmin

Excellent! I appreciate your flexibility. I have reserved a vehicle (1142) for us next week. Let's meet at the employee entrance around 0700. It should be a 45 minute drive to the meeting point off Mt Israel Road. Be prepared to hike up the access road (~2 miles round trip) and/or to stand in the cold. Eversource asked us to have PPE: it'd be best to have a hard hat, safety glasses, high-vis vest, and boots. If you have yaktrax or other traction cleats that would probably be good to have as well for some extra grip now that we're well into the winter months. Let me know if you have any questions. Look forward to the field trip with you both!
